

Ghostkeys

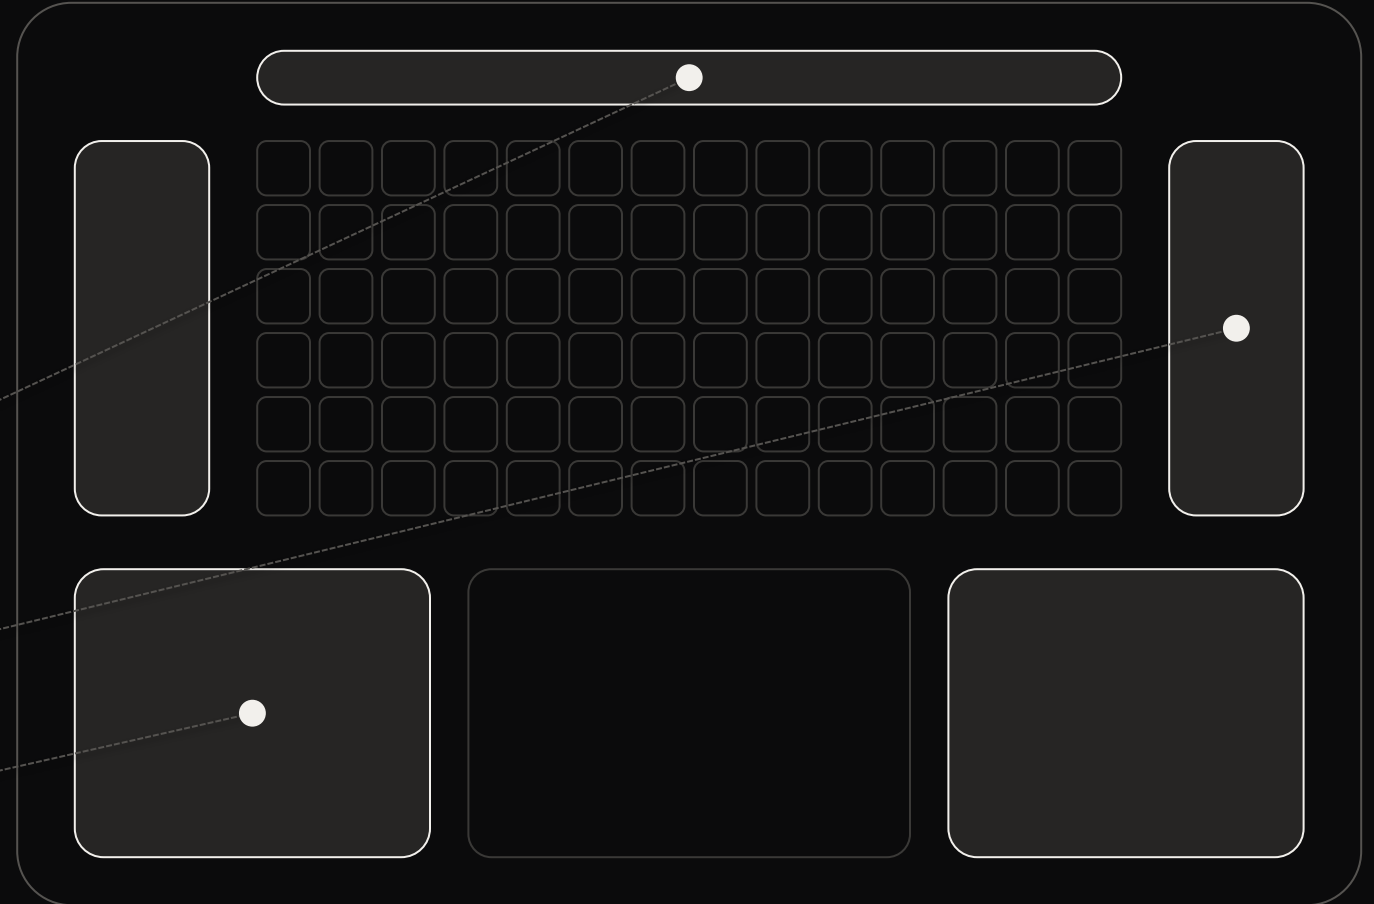

Every blank surface of your MacBook is a key.

Tap the parts
that do nothing.

Last app

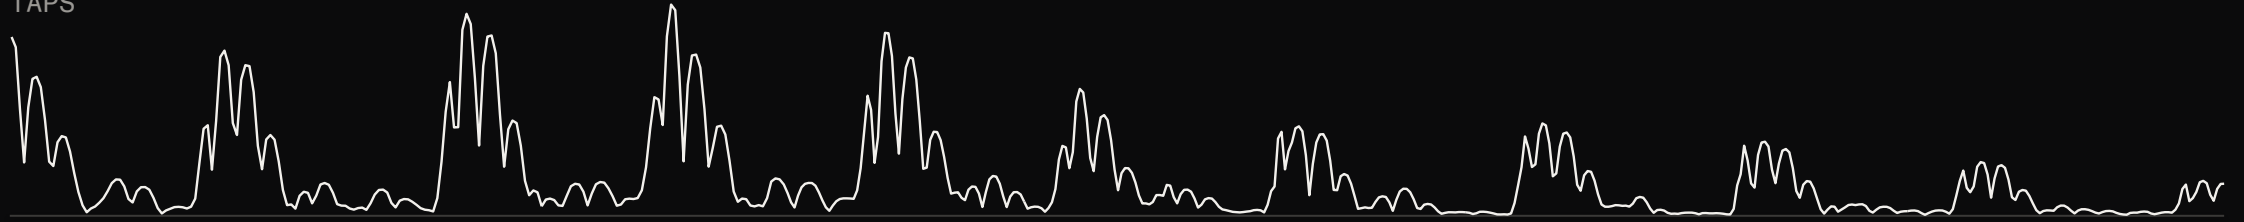

Screenshot

Mute

A tap looks a lot like a keystroke.

TAPS

TYPING

Something hit

The sensor jumps above the laptop's normal background shake.

Not typing?

If a key or the trackpad moved at that moment, it is ignored.

Which spot?

33 measurements of the bump.
Two small models compare it with the taps you gave during setup.

Unsure? Do nothing

If it does not look like your taps, nothing fires. It also learns desk and lap separately.

Real sensor data, 800 readings a second. Everything runs on the laptop; nothing is sent anywhere.

Hands in the air. No camera.

The speakers play two tones too high to hear. The mic hears your hand bend them.

RAISE OR LOWER YOUR HAND: VOLUME

PUSH OVER A SIDE: SWITCH APPS

Or use the camera.

Optional and off by default. Pinch in front of the screen to control things from across the desk.

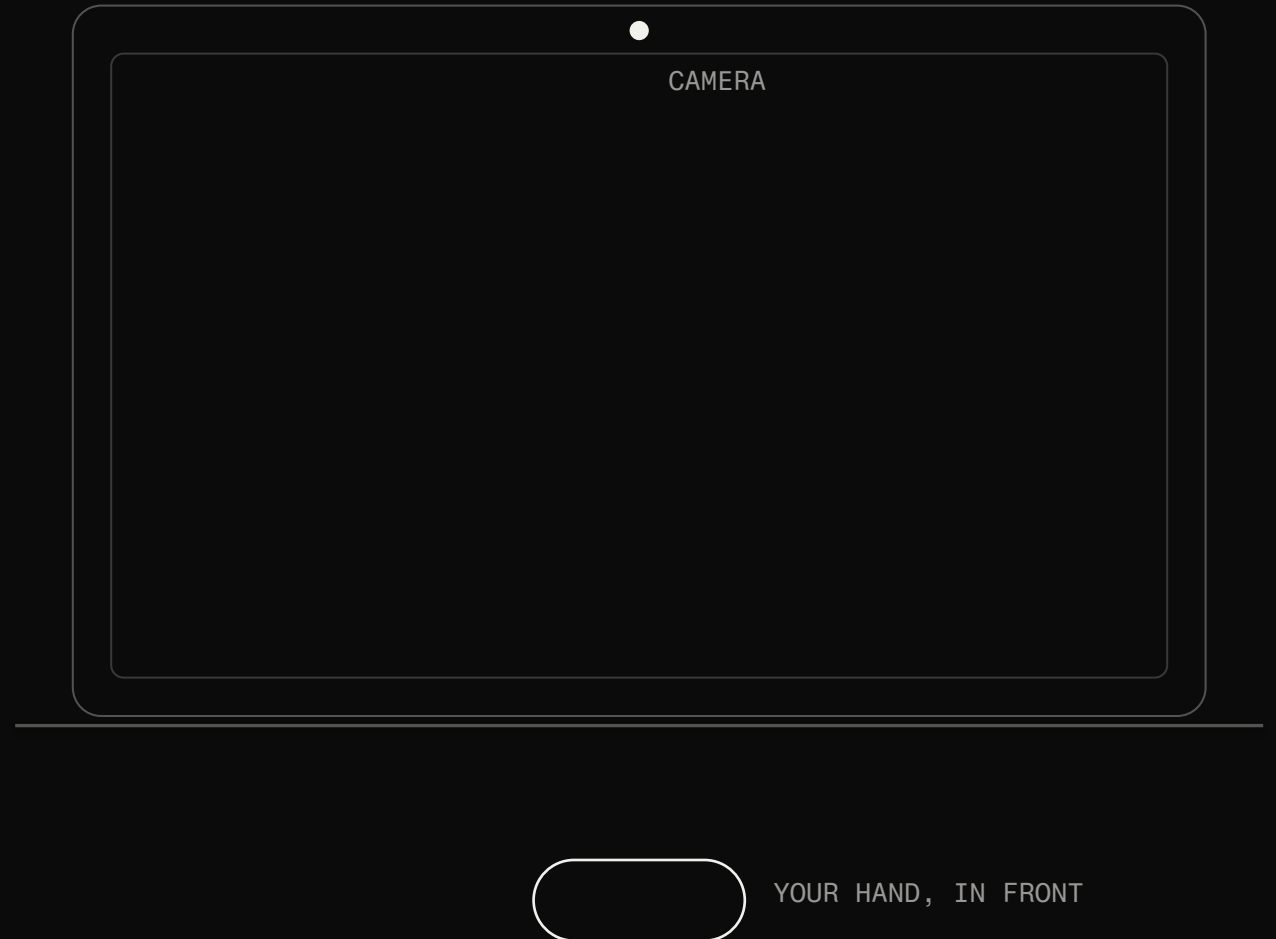

Air tap

Pinch and turn, like a dial

Pinch and drag

Palm swipe

PROCESSED ON THE MAC. NO VIDEO IS SAVED OR SENT.

It works.

1.4%

wrong taps

FROM 16.5%

0

false taps when you move it

FROM 2 A MINUTE

84%

taps caught on a lap

FROM 0%

Measured on our own recordings and re-checked independently.

Who it's for.

Anyone who lives on a MacBook and repeats the same few actions all day.

Spreadsheet people

Run a macro or AutoSum with a palm tap.

Designers

Undo and switch tools without leaving the canvas.

Developers

Build, run and jump between windows.

Anyone on calls

Mute with a tap they can find without looking.

Works on the MacBook they already carry: desk, couch, train.

Free to try. Pay once to unlock everything.

FREE

\$0

two palm buttons

PRO

\$29

once, everything

TEAMS

\$49

per seat, per year

Every Apple silicon MacBook already has the sensor. Free during the beta.

Try it on the laptop in front of you.
